

● PITCH DECK · 8 SLIDES

Agents can now pay. You decide *what* they're allowed to buy.

Policy simulator and guard layer for AI agents using pay.sh / x402-style payments on Solana.

Run the demo →

currentlycoding.github.io/agentpass-guard

Agents can pay. Now humans need controls.

Builders without a policy layer have two bad choices: approve every micro-payment by hand, or hand the agent unlimited credentials. Neither scales.

- Pay.sh and x402 unlock agent-paid APIs on Solana.
- Unrestricted agent wallets are unsafe.
- Manual approval for every micro-payment kills autonomy.
- Builders need to test budget, allowlist, threshold, and revocation before live spend.

THE WEDGE

Pay.sh and x402 give agents a checkout. We give builders the brakes.

THE WEDGE

Pay.sh and x402 give agents a checkout. AgentPass Guard gives builders the brakes.

01

Without a policy layer

You either approve every micro-payment by hand, or hand the agent unlimited wallet access. Neither scales.

02

With AgentPass Guard

A human-defined pass: budget, allowlist, threshold, expiry, revocation. Every paid call is evaluated and explained before settlement.

03

On Solana

Approved actions settle on devnet with a Memo-program receipt. Cheap, fast, inspectable — the right rail for agent payments.

HOW IT RUNS

Set a policy. Watch the agent get checked. Three actions, three traces.

AgentPass Guard

How it worksLive demoSolana proofSubmissionTry the demo

LIVE DEMO

Set a policy. Watch the agent get checked.

Three scripted actions — one auto-approves, one is blocked, one needs a human. Every decision is shown with the exact guardrail trace.

STEP 1 · HUMAN POLICY

Research Agent Pass

Agent name

Research Agent

Daily budget

0,25USDC

Auto-approve below

0,02USDC

Allowed services

☒ Pay.sh Research API

☒ Pay.sh BigQuery

☐ Pay.sh Knowledge Graph

STEP 2 · SCRIPTED AGENT

Try paid actions

SHOULD APPROVE

Allowed API call

Pay.sh Research API · 0.008 USDC

SHOULD BLOCK

Blocked tool

Unapproved scraping API · 0.006 USDC

NEEDS APPROVAL

High-cost call

BigQuery dataset · 0.075 USDC

Approved. Blocked. Paused for human.

Each click runs the policy through five guardrail checks and produces an audit-grade decision.

0.008 USDC • ALLOWLISTED

Auto - approved

ALLOWLIST FAIL

Blocked before settlement

0.075 USDC • ABOVE THRESHOLD

Paused for human

Small, frequent, programmatic — with receipts.

- Fast confirmation keeps agent workflows interactive.
- Low fees make sub-cent API payments economically viable.
- Wallet-native identities map cleanly to autonomous agents.
- Memo program turns each settlement into an inspectable receipt.

DEVNET PROOF

```
$ npm run devnet:demo
```

Creates a temp wallet, sends a tiny payment, attaches a Memo-program receipt, prints the explorer link. Falls back to a simulated receipt if the public faucet is rate-limited.

WHAT'S SHIPPING

Static app. No backend. Judges run it in 30 seconds.

No actions yet. Run the scripted agent to create receipts.					

SOLANA PROOF

Approved actions can settle on devnet, with a memo-program receipt.

From local simulator to production guardrail.

- Land with AI builders and student teams using paid APIs.
- Add SPL USDC settlement and pay.sh / x402 request parsing.
- Add team approval workflows, anomaly alerts, and spend analytics.
- Move policy checks into wallet middleware and server-side authorization.

WHY THIS CAN WIN

Completes the rail.

The problem is current. The demo is concrete. The Solana integration is real. The wedge does not fight the ecosystem — it completes it.
